**Abstract**

A Chum Tube Lure designed for catching fish by spreading a chum slick or fish oil attractant out the back of a chum tube and over the lure. Chum or fish oil attractant is inserted into the head of the chum tube and fills the inside of the tube. Inside the tube is a piece of manila rope used to absorb the fish oil and slow the process of spreading the chum slick or fish oil out and over the lure. As the Chum Tube Lure is trolled through the water, water flows through the head at the front of the chum tube forcing the fish oil out the back of the chum tube and over the lure. The Chum Tube Lure such as a chum tube eel is a tube eel attached to the back section of the chum tube. The chum tube eel or lure is spinning around creating noise and vibrations in the water. This accompanied by the fish oil attractant flowing over the lure helps to attract fish to the lure.
